

# PCB 3043 Assignment 3

- There is competition between these two flying squirrels at different elevations; when the species coexist their populations behave differently.
- At 1200m both species can thrive independently which is an indicator of competition
- The SFS “won” at elevations above 1200m, the NFS “won” at elevations below 1200m, and these species coexist and compete around 1200m.
- After testing each starting population value 10 times, we found *G. sabrinus* to be the better average competitor overall and especially at high elevations.
